                counter++;
            }
        }
    }
    cout<<"BFS : "<<endl;
    for(int i = 0; i < vertexSize; i++){
        cout<<output[i]<<" ";
    }
}

```

ScreenShot

```

BFS :
1 2 3 4 5 7 8 6

```

Maka nilai kompleksitas waktu dari BFS adalah $O(|V| + |E|)$.

Karena Big-O dari BFS adalah $O(V+E)$ dimana V itu jumlah vertex dan E itu adalah jumlah edges maka Big-O = $O(n)$ dimana $n = v+e$.

Maka dari itu Big- θ nya adalah $\theta(n)$.

4. Buatlah program Depth First Search dari algoritma DFS yang telah diberikan. Kemudian uji coba program Anda dengan menginputkan undirected graph sehingga menghasilkan tree DFS. Hitung dan berikan secara asimptotik berapa kompleksitas waktunya dalam Big- Θ !

```
#include <iostream>

#include <list>

using namespace std;

class Graph{

int N;

list<int> *adj;

void DFSUtil(int u, bool visited[]){

visited[u] = true;

cout << u << " ";

list<int>::iterator i;
```

```

for(i = adj[u].begin(); i != adj[u].end(); i++){
    if(!visited[*i]){
        DFSUtil(*i, visited);
    }
}

}

public :

Graph(int N){
    this->N = N;

    adj = new list<int>[N];
}

void addEdge(int u, int v){
    adj[u].push_back(v);
}

void DFS(int u){
    bool *visited = new bool[N];

    for(int i = 0; i < N; i++){
        visited[i] = false;
    }

    DFSUtil(u, visited);
}

```

```
}  
  
};

    g.addEdge(1,3);  
    g.addEdge(2,3);

    g.addEdge(5,6);  
    g.addEdge(7,8);  
  
    cout << "\nDFS Traversal Starts from Node 1" << endl;  
  
    g.DFS(1);  
  
    return 0;  
}
```

ScreenShot

```

```

DFS merupakan metode pencarian mendalam, yang mengunjungi semua node dari yang terkiri lalu geser ke kanan hingga semua node dikunjungi. Kompleksitas ruang algoritma DFS adalah $O(bm)$, karena kita hanya perlu menyimpan satu buah lintasan tunggal dari akar sampai daun, ditambah dengan simpul-simpul saudara kandungnya yang belum dikembangkan.
